PRELIMINARY AMENDMENT

Commissioner for Patents

Washington, D.C. 20231

Sir:

Prior to the first Official Action and calculation of the filing fee, please amend the above-identified application as follows:

IN THE CLAIMS:

Please amend claim ⁴~~3~~ as follows:

⁴~~3~~. (Amended) Apparatus according to Claim 3, which includes means operable to define, for each utterance, an utterance period comprising a first time period for measuring said acoustic noise level and a second time period during which said utterance is made.

Melvyn John HUNT

Claim ⁴~~3~~ was amended to correct multiple dependencies.

Attached hereto is a marked-up version of the changes made to the claim by the current amendment. The attached page is captioned "VERSION WITH MARKINGS TO SHOW CHANGES MADE".

Respectfully submitted,

YOUNG & THOMPSON

Speech Processing

This invention relates to apparatus and a method for estimating the speech level of a speaker exposed to an environment containing a variable amount of acoustic noise.

5 In particular, but not exclusively, the invention relates to such apparatus and methods for use in speech recognition.

The central process in automatic speech recognition is the comparison between some representation of the speech to
10 be recognised and a set of reference models corresponding to speech sounds or words or other units. It is important that the level of the speech signal represented in the recogniser should be close to that expected by the models.

Because speech sounds vary in their intrinsic loudness,
15 measuring overall speech level is not a trivial process. It is necessary either to take a large enough sample of the speech that the variations occurring between speech sounds average out, or to compare an utterance whose level is to be measured with an utterance at some known level whose
20 phonetic content is the same. In this second method, phonetically identical speech sounds can be compared, but it does require a knowledge of the content of the utterance to be measured.

We have realised that it is in fact possible to
25 estimate variations in the likely level of the speech signal in acoustically noisy environments by measuring the ambient noise level and using a phenomenon known as the Lombard
